Madhav Biradar | July 16, 2020| Tizen Help | The entry of the new Huawei Watch GT 2 & Watch GT 2e has brought plenty of functions along with elegant built quality. After Huawei terminates its relationship with Wear OS by Google and presents its Light OS. In 2018 & 2019, Huawei Watch & Watch 2 has somehow become popular with users. The upside of Wear OS watches is that they get hundreds of apps to use with a smartwatch. Also, back in the days we ranked some of the best apps for Huawei watches. This is a lack of Light OS that does not have any applications or has an application library. Although there aren't many apps in Huawei library, it gets a lot faster and lasts longer in battery life. This is why most users choose Watch GT & GT 2e over Fossil Gen 5, Mobvoi TicWatch C2+ & other Wear OS watches. Now, you may be curious, if there are not many applications on the board, then how can we use essential applications. Well, don't worry, some third-party developers have built the best apps for Huawei Watch GT smartwatches, Watch GT 2 & GT 2e. In the future, Huawei & Honor can open its library for developers, so they could create more apps, by then use these below apps. Best apps for Huawei Watch GT 2 & GT 2e.1. A navigator for Huawei GPS & navigations apps is essential for many smartwatches, and users prefer watches that have GPS technology. The Huawei Band & Watch navigator promises you to deliver the exact direction of Google Maps on wearables. According to the description in the Play Store, it shows you all the instructions. For some advanced features, you go with its premium subscription, although you can meet the free version. It supports new watches along with Watch GT, Band 3, Band 4 & Band 4 Pro.2. Huawei Watch MapsAnother app that gets help from Google Maps to see directions. Apple Watch, Galaxy Watch & Fitbit supports here wego app. Here weGo is a well-rated app and is used by millions of users on smartphones as well as smartwatches. The Huawei Watch Maps app doesn't show you the full map on the main screen, but gives you a direction notice. To get notified, you must download Google Maps to your smartphones, and then enable app notification on the Huawei Watch GT 2 & GT 2e.3. Huawei HealthIt is the first stop for your Huawei smartwatches. You can pair your smartwatch with smartphones using Huawei Health. It's a common app for Huawei & Honor wearables, so you can connect the Watch GT 2, GT 2e, MagicWatch 2, MagicWatch and all the other smart bands. From You can see Huawei Health's fitness data, app alerts, viewing number, and many other settings. You can install the Health app from the Android Play Store & Apple App Store. We don't have to mention the app here, because without pairing the pairing Look with him, you can't use it. nevertheless, many first-time users need to know about it. We know this isn't enough of a list of apps. We must at least mention five apps from the store. The lack of apps has stopped us here with only three apps, but we promise you will update the list. If you know the new apps that support these smartwatches, let us know in the comments below. We'll update the article when we know the new apps. Madhav Biradar began his career in technology back in 2011, where he covered mobile and gaming articles. He is an enthusiast in smartphones and wearable devices. In his spare time, he likes to read about new tech gadgets and watch movies. It feels like a watch, it looks like a watch, but is the Huawei Watch GT a real smartwatch? It's a question that looms over the device during my time with it. Outside the bat, Huawei wants users to make sacrifices and commitments with their latest wearable: know that you don't get any third-party apps, but trust that you get a solid first-party experience. It's a lot to look for when there are other smartwatches out there, and that might explain why the company was giving them away when it launched the P30 Pro in Canada. Having worn and used the watch for more than a month, it's a tough call about how effective it will be in the long term. Starting over by going with its own LiteOS platform, Huawei has abandoned Google's Wear OS, and all compatible apps along with it. The decision was curious, given that the Wear OS competition is relatively light, but also understandable due to the lack of traction of that platform. The move carries both positive and negative consequences. On the one hand, software reduction dramatically improves battery life. On the other hand, it limits the usability of the watch in ways that would make it "smart". So there is a constant exchange here, which is why I suggest you read this review to assess whether this is what you are looking for or not. There are two variants: one with a black stainless steel frame and the other with silver stainless steel. My unit's belt is officially called black, although it's more like emerald black (if that's the right color) because of its greenish color. They were nicknamed Sport and Classic, but so far I have not seen it in any Canadian marketing material. I was taken aback by how many people complimented the Watch GT while wearing it. I never even asked in almost all these cases, friends and acquaintances volunteered their opinions. I usually got along. The watch is tastefully designed, with a mixture of elegance and casual functionality, but also surprising robustness. The 46 mm housing, ceramic frame and glass are coated with carbon for improved scratch resistance. A waterproof rating of 5ATM means it's perfectly fine in the pool or shower. The rubberised strap looks nice, and the standard lugs mean you can put any other strap you want on it. For example, I put the tapes I used on Fitbit Versa and Versa Lite and they were fine. 1.39-incg, 454 x 454 pixel resolution, the AMOLED display is vibrant and responsive. Both physical buttons, one that acts as a home, the other as a shortcut to exercise, are also nice touches. The optical heart rate monitor sits below at the bottom. Huawei also put a 420mAh battery inside, which it rates for up to two weeks per charge. More on that later. Features and software Powered by ARM Cortex-M4 processor paired with Huawei's liteos, hardware-software marriage works well here. The watch felt fluid and quick to navigate, although I can't give too many brownie points for aesthetics. It's a basic interface, lacking flair, but it's pretty easy to use and understand. Part of the reason is that he would use it in a kind of fenced garden. I had no way to browse or install third-party apps. There is no app store, and as far as I know, there is no way to fork or sideload either in, either. Even if you want to store apps on your Watch GT, you'd be stymied by a pitiful 128MB of storage. This is the official figure, but the fine print confirms that the actual available storage is lower than that. This means there's no way to enter a compatible music app, or even a map to help you bypass it. Amazingly, despite supporting Bluetooth, there is no way to control music playback. I can accept the lack of Wi-Fi, given the circumstances, but with music, I would have to pull out my phone or use the controls on my headphones. The built-in options are mainly activity-oriented. Various trainings are available, such as outdoor or indoor running, cycling, walking, swimming and triathlon training. The second section tracks all other activities. None of it worked automatically in my testing. You don't get dedicated heart and sleep tracking, plus find my choice of phone for when paired phones are misplaced. In addition, there is a barometer, compass stopwatch, time, lamp, timer and alarm. I mostly tested the Watch GT while paired with the P30 Pro, where there's a direct link to Huawei's Health app, but the company says the watch also works with MyFitnessPal and Apple's HealthKit. Being active My mistake wasn't always activating my training clock which is why I lost my metric monitoring. I would get steps and calories, but not duration, heart rate and data specific to said exercise. After using other trackers, such as Samsung's Galaxy Watch Active and Fitbit Versa, I was spoiled by more autonomous tracking. When I activated it to monitor exercise at the gym, it wasn't bad. For about 10 days, I wore a Watch GT on one wrist and a Fitbit Versa Lite on the other. The number of steps often varied, by as much as 1,100 steps on one particular day when the Watch GT introduced a more conservative total. In none of those days did the Watch GT keep up with more steps than Versa Lite. Since Huawei's watch has solid GPS support, it fared better outside where it accurately presented distance tracking. Monitor it is also Well, never slip too far from any other device I tested at the same time. I'd say it's off about five beats per minute, on average, but not always. Sometimes it can be almost spot-on. I can't say the same thing about sleep monitoring, which wasn't always right. It was fine on the note of total sleep time, but not always on the line. Light sleep and REM were confusing because they would assume I slept lightly while just reading a book in bed. I've seen better results in other smartwatches and Fitbit's lineup. Battery life I Rarely used a rechargeable smartwatch or fitness tracker that can compete with the Watch GT for battery life. Over the course of 35 days, I only had to fill it twice, and even then, it was never completely dead. With the leisurely use of fitness tracking features, I could easily see a watch for three weeks or longer before reaching for the charger. Using tracking every day, and liberal use of GPS will specifically bring it down. But still, this was a truly impressive battery life. Life.
